

# VoiceChannel Class

Wraps a **TransportChannel** and an associated **MediaEngine** object in a voice chat application. This object is created by the **ChannelManager** at the behest of the **Call** object when it creates a new **Session**. **VoiceChannel** is passes a **Session** object, but only uses it to create a **TransportChannel**.

**VoiceChannel** acts as the conduit for audio data between **TransportChannel** and **MediaChannel**, and can be used to stop or start the data flow (by muting or unmuting the data channel). Incoming data packets are received from **TransportChannel**, which calls **VoiceChannel::OnSocketRead**, which in turn calls **MediaChannel::OnPacketReceived**. Outbound packets are sent to **VoiceChannel::SendPacket**, which calls **TransportChannel::SendPacket**.

You should not need to modify override this class, although you could use it as a model for other rendered media session types (such as video).

## Syntax

```
class VoiceChannel : public MessageHandler,
                    public sigslot::has_slots<>,
                    public MediaChannel::NetworkInterface
```

## Methods

Name	Description
MediaChannel* <b>channel</b> ()	Retrieves the <b>MediaChannel</b> object used to instantiate <b>VoiceChannel</b> .
void <b>Enable</b> (bool <i>enable</i> )	Enables or disables the voice channel, depending on the value passed to <i>enable</i> . True means enable, False means disable. (Enable means to send and receive audio data.)
int <b>GetInputLevel_w</b> ()	Returns an input level value from the media engine. The range and meaning of this number is determined by the media engine implementation used.
int <b>GetOutputLevel_w</b> ()	Returns an output level value from the media engine. The range and meaning of this number is determined by the media engine implementation used.
void <b>Mute</b> (bool <i>mute</i> )	Mutes and unmutes the outbound audio data, depending on the value passed in. True mutes the channel; False unmutes the channel. Note that incoming audio will still be rendered.
void <b>PauseMedia_w</b> ()	Called by <b>ChannelManager</b> to temporarily stop the data flow so that it can change audio devices ( <b>MediaEngine::SetSoundDevices</b> ).
void <b>SendPacket</b> (const void * <i>data</i> , size_t <i>len</i> )	Sends a packet of data of <i>len</i> bytes across the network. This is the implementation of the <b>MediaChannel::NetworkInterface::SendPacket</b> pure virtual method.
Session* <b>session</b> ()	Returns the <b>Session</b> object associated with the <b>TransportChannel</b> managed by this object.
void <b>StartAudioMonitor</b> (int <i>cms</i> )	Starts sending audio information through <b>SignalAudioMonitor</b> . This is called

	by <b>Call::StartAudioMonitor</b> .
void <b>StartConnectionMonitor</b> (int <i>cms</i> )	Starts sending connection information through <b>SignalAudioMonitor</b> . This is called by <b>Call::StartConnectionMonitor</b> .
void <b>StopAudioMonitor</b> ()	Stops sending audio information through <b>SignalAudioMonitor</b> . This is called by <b>Call::StopAudioMonitor</b> .
void <b>StopConnectionMonitor</b> ()	Stops sending connection information through <b>SignalAudioMonitor</b> . This is called by <b>Call::StopConnectionMonitor</b> .
void <b>UnpauseMedia_w</b> ()	Called by <b>ChannelManager</b> to restart sending audio data stopped by calling <b>PauseMedia_w</b> .
<b>VoiceChannel</b> (ChannelManager <i>*manager</i> , Session <i>*session</i> , MediaChannel <i>*channel</i> )	Constructor. Creates a <b>TransportChannel</b> object using the <b>Session</b> object passed in.
<b>~VoiceChannel</b>	Destructor. Destroys the <b>TransportChannel</b> object that it created when it was instantiated.
Thread* <b>worker_thread</b> ()	Returns the worker thread used to handle resource-intensive applications (used to send signals to this object's <b>OnMessage</b> method).

## Signals

**SignalConnectionMonitor** < **VoiceChannel** \*, const std::vector< **ConnectionInfo** > & >

Sends information about the current connection. To start this signaling, you must call **StartConnectionMonitor**.

**SignalAudioMonitor** < **VoiceChannel** \*, const **AudiInfo** & >

Sends information about the current audio data. To start this signaling, you must call **StartAudioMonitor**.

**Attributes:** public
